1.1. Project Description

SYSTEM MODELING

This example shows how to use Stood project and design concepts to elaborate a well structured system/software architecture from textual specifications.

The PROJECT section aims at well separating the "System to Design" from its environment

According to the Requirements Engineering Management Handbook, DOT/FAA/AR-08/32, June 2009, "One way to define the system boundary is to view the system as a component that interacts with its environment through a set of monitored and controlled variables"

This is shown in the "Project Sketch" sub-section.

"The monitored variables represent quantities in the environment that the system responds to, while the controlled variables represent quantities in the environment that the system will affect. For example, monitored values might be the actual altitude of an aircraft and its airspeed, while controlled variables might be the position of a control surface, such as an aileron or the displayed value of the altitude on the primary flight display. Conceptually, the monitored and controlled variables exist in the environment outside of the system and would continue to exist even if the system were eliminated. The purpose of the system is to maintain a relationship between the monitored and controlled variables that achieves the system goals. The definition of the monitored and controlled variables and their attributes define the boundary of the system."

A list of Monitored and Controlled variables is provided in the "Project Table" sub-section.

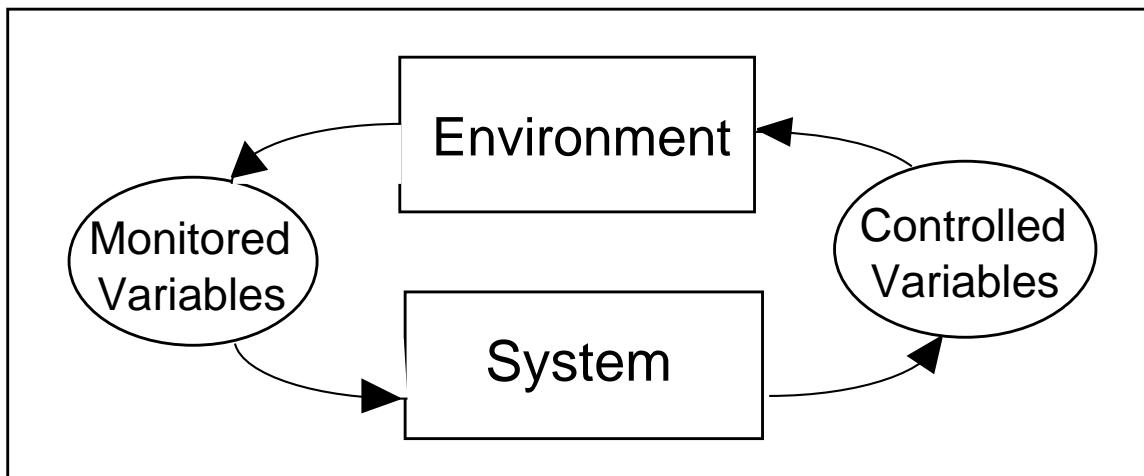

A list of Requirements that must be covered by the design entities can be loaded into the tool thanks to the Requirements editor. Once loaded, this list is displayed in the "List of Requirements" sub-section.

Note that this section is read-only, any change to the list must be performed through the Requirements editor.

The two last sub-sections are also read-only and provide the current state of the Design Tree (hierarchy of components) and the Inheritance Tree, when appropriate. With Stood, Inheritance Tree is only provided for AADL Data component classifiers specified in an AADL Package design.

The diagram associated to the PROJECT shows the main "System to Design" (Isolette) that is graphically represented by an AADL System and corresponds to the root of the instance hierarchy. The diagram also contains a set of AADL Packages identifying the libraries of AADL Data component classifiers that are used by the Isolette model.

1.2. Project Sketch

1.3. Project Table

	Name	Type	Physical Interpretation
	Current Temperature	Monitored	Current air temperature inside Isolette
	Operator Settings		Thermostat settings provided by the operator
	Desired Temperature Range		Desired range of Isolette temperature
	Lower Desired Temperature	Monitored	Lower value of the Desired Temperature Range
	Upper Desired Temperature	Monitored	Upper value of the Desired Temperature Range
	Operator Feedback		Information provided back to the operator
	Display Temperature	Controlled	Displayed temperature of the air in Isolette
	Heat Control	Controlled	Command to turn the heat source on or off

2. SYSTEM Isolette IS

2.1. DESCRIPTION

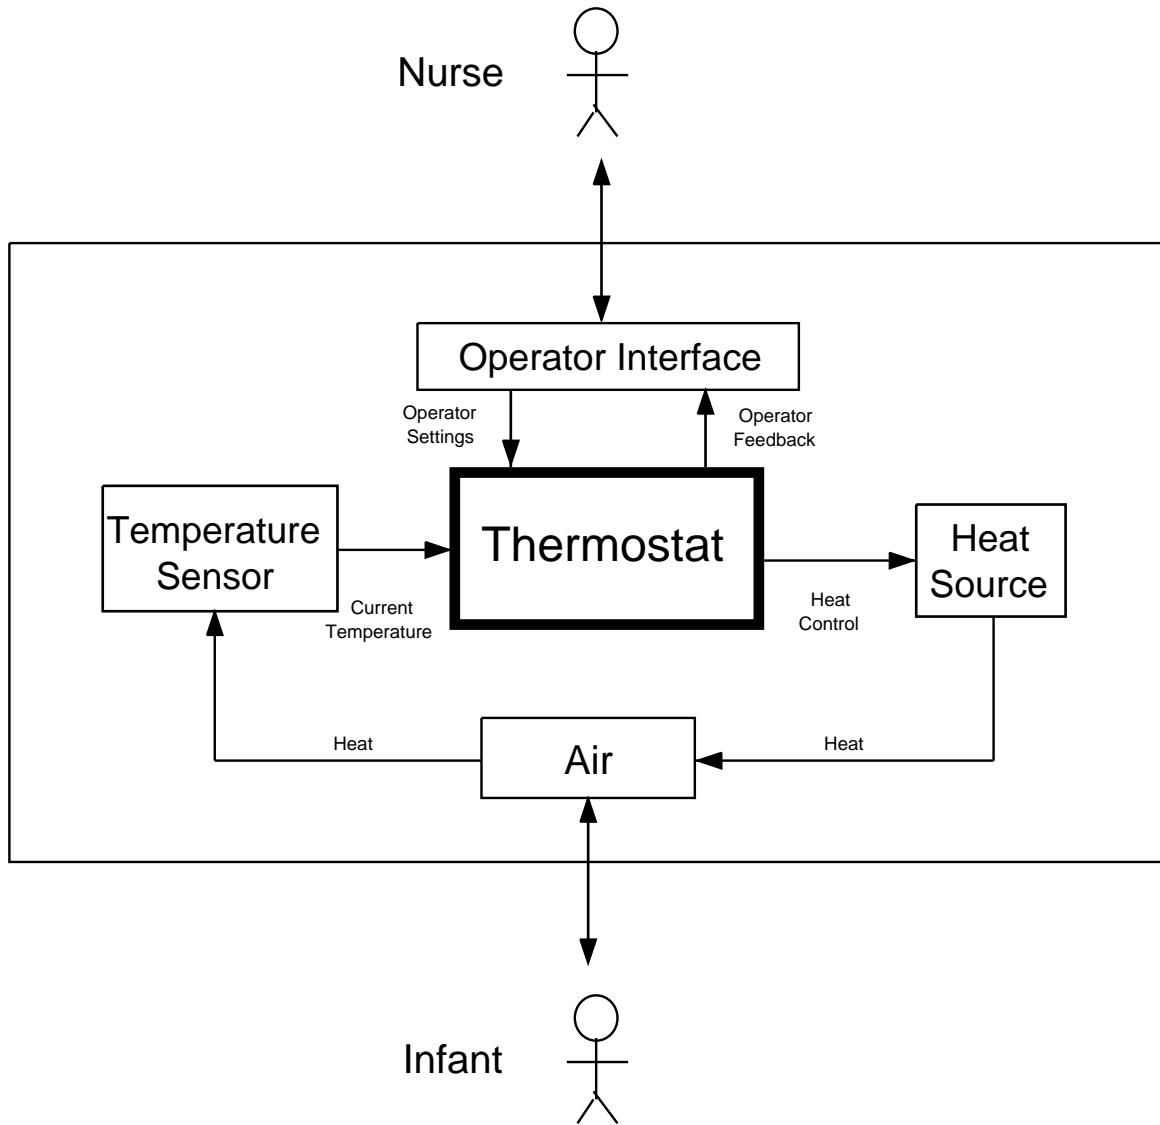

2.1.1. PROBLEM

2.1.1.1. Statement of the Problem (text)

The system being specified is the Thermostat of an Isolette. An Isolette is an incubator for an Infant that provides controlled temperature, humidity, and oxygen (if necessary). Isolettes are used extensively in Neonatal Intensive Care Units for the care of premature infants.

The purpose of the Isolette Thermostat is to maintain the air temperature of an Isolette within a desired range. It senses the Current Temperature of the Isolette and turns the Heat Source on and off to warm the air as needed. If the temperature falls too far below or rises too far above the Desired Temperature Range, it activates an alarm to alert the Nurse. The system allows the Nurse to set the Desired Temperature Range and to set the Alarm Temperature Range outside the Desired Temperature Range of which the alarm should be activated.

2.1.1.2. Sketch of the Problem

2.1.1.3. Referenced Documents

[1] This model is directly inspired from the ISOLETTE THERMOSTAT EXAMPLE provided in APPENDIX A of the Requirements Management Handbook, DOT/FAA/AR-08/32, June 2009.

Authors: David L. Lempia and Steven P. Miller, Rockwell Collins, Inc.

[2] This model is implemented with the Architecture Analysis and Design Language (AADL), SAE-AS5506B, Sept 2012

[3] Design choices are inspired by the corresponding example provided by the Requirements Definition and Analysis Language Annex draft v161.

2.1.2. SOLUTION

2.1.2.1. General Strategy (text)

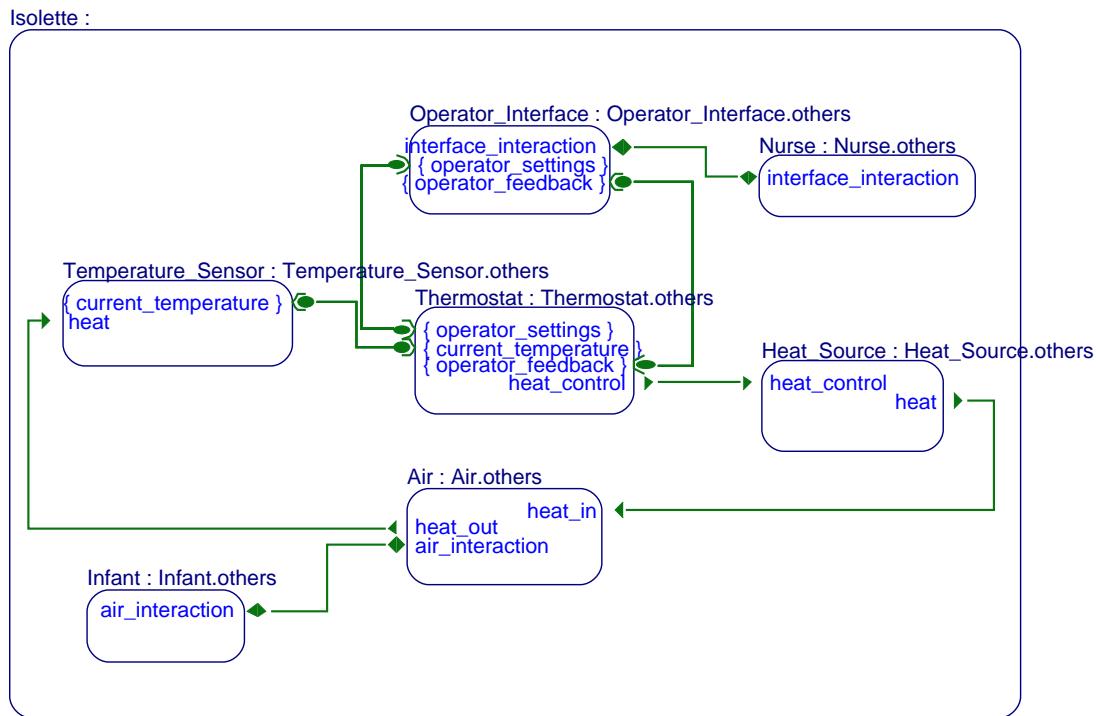

The Thermostat interacts directly with three entities that are part of the Isolette:

- The Temperature Sensor provides the Current Temperature of the air in the Isolette to the Thermostat.
- The Heat Source heats the Air in the Isolette. It is turned on and off by the Heat Control.
- The Operator Interface provides the Operator Settings for the Thermostat and receives Operator Feedback from the Thermostat.

The Thermostat also interacts indirectly with other entities outside of the Isolette:

- The Nurse who uses the Operator Interface to enter the Operator Settings and view the Operator Feedback.
- The Air in the Isolette.
- The Infant that is placed in the Isolette and is warmed by the Air.
